

Design of multifunctional polymeric binder for Si - anodes in Li-ion batteries

Harshan Madeswaran¹, Yongsheng Zhang¹, Giuseppe Portale¹

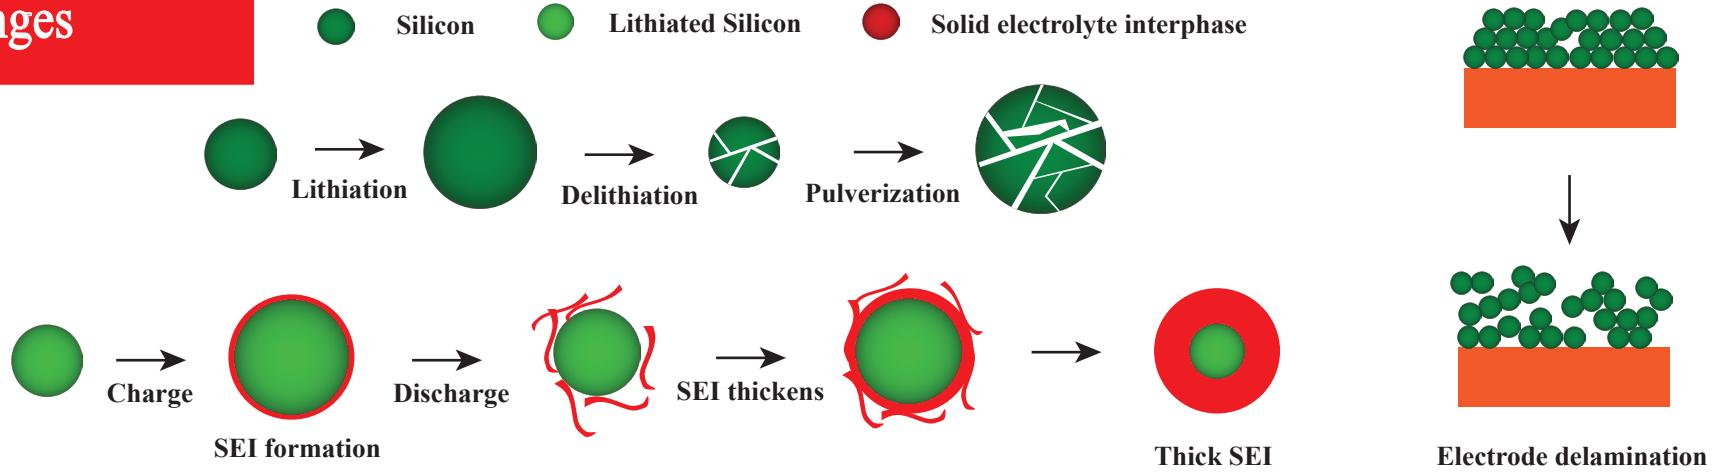

¹Physical chemistry of polymeric and nanostructured materials,
Zernike Institute for Advanced Materials, University of Groningen, Nijenborgh 3, 9747 AG Groningen

Why study Si anodes ??

- 10x higher specific capacity over graphite
- Low cost and abundant
- Next generation Li-ion batteries - long lasting and energy dense

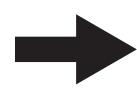

Challenges

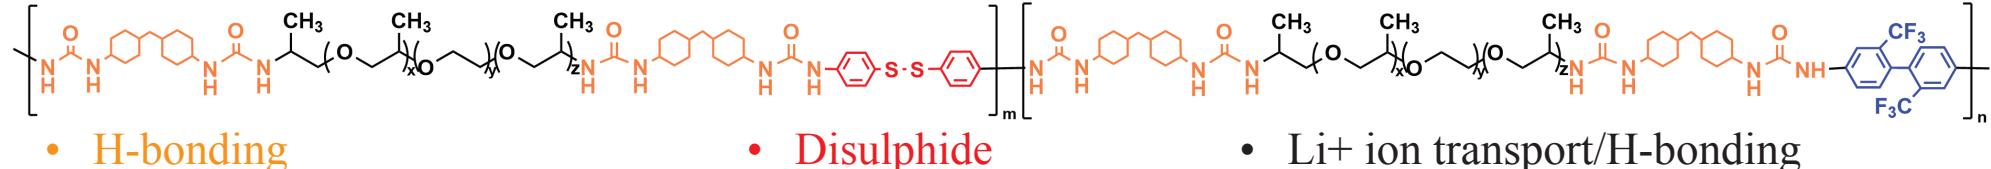

Polymeric binders

Polyvinylidene fluoride

- Van der Waals interaction

PUSF - Supramolecular polymer

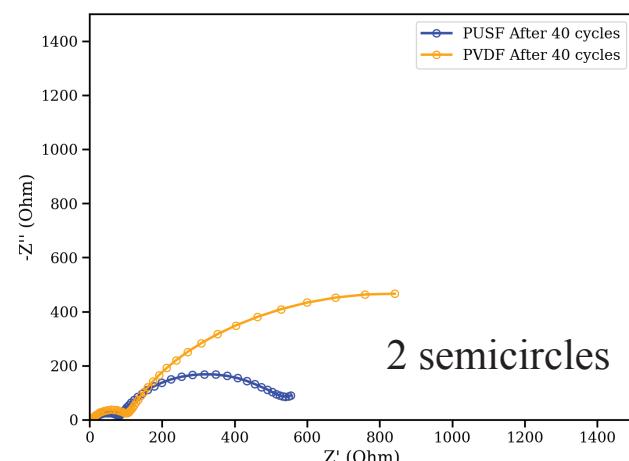

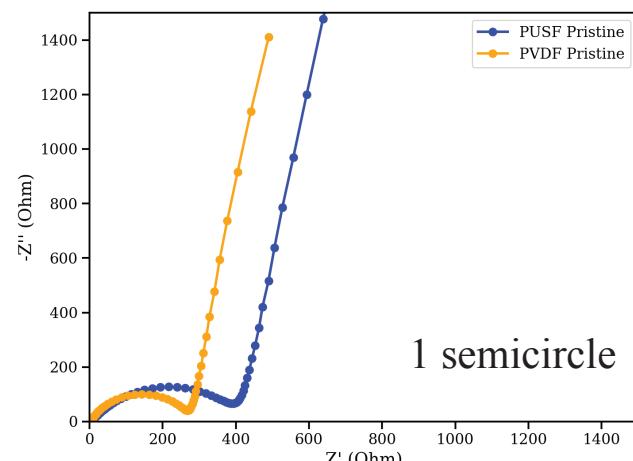

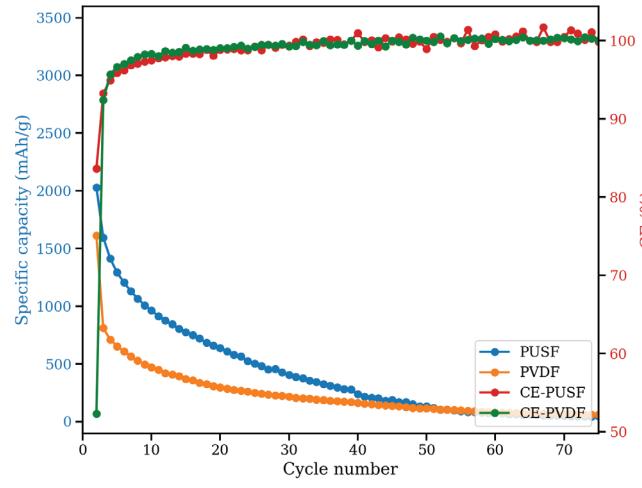

- H-bonding

- Disulphide

- Li⁺ ion transport/H-bonding

Results

- Li/Si half cell
- 6:2:2 electrode composition
- 1M LiPF₆ in EC/DMC = 50/50 v/v + 10% FEC
- Slightly improved cycling performance with PUSF
- Fast capacity decay with PVDF binder

- Before cycling: One charge transfer interphase
- After cycling: SEI + charge transfer interphase

"Two semicircles = Complex interfacial processes during cycling"

Outlook

- Ex-situ SEM, XPS, and (GI)-SAXS/WAXS
- Operando X-ray scattering measurements
- Adhesion tests and 180° peel off test
