Why Solvent-Free Polypyrrole for Supercapacitor ?

- **Supercapacitors:** rapidly storing and releasing high electrical power
- **Enhancing performance:** conducting polymers + carbon materials
- **Traditional methods face:** solubility challenges, delamination, and harmful solvent

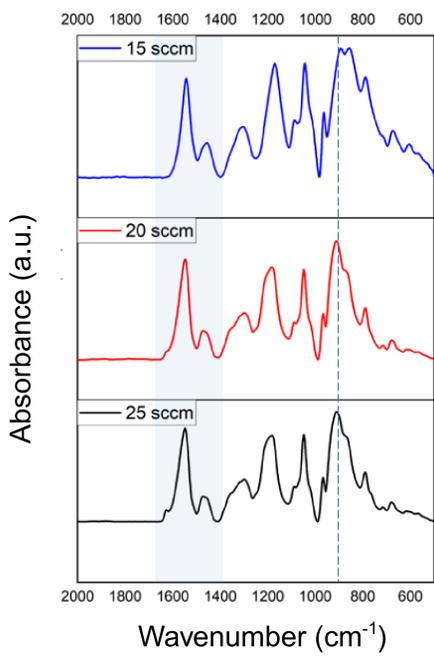

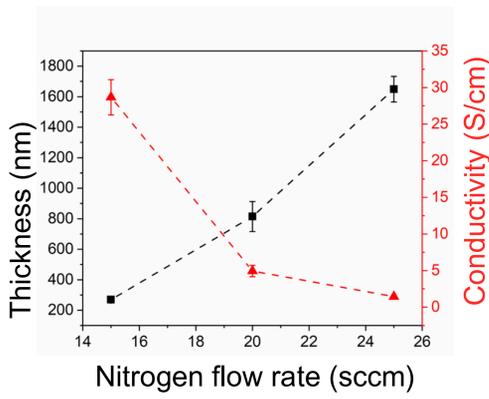

Innovation: oCVD Technique

- Oxidative chemical vapor deposition
- Solvent-free method
- Simultaneous synthesis, doping, and film formation
- Conformal coatings of PPy on carbon materials

Parameters	Value
Chamber pressure	300 mTorr
Stage temperature	40° C
RR→Reactant ratio [Ox]/[Mo] (sccm/sccm)	[0.5 sccm/2.5 sccm]
Nitrogen flow	15 – 25 sccm
Deposition time	30 – 120 min
Substrate	Si wafers, Glass, Fabric

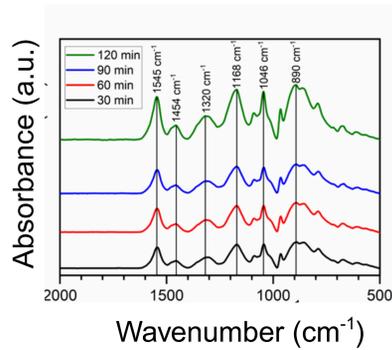

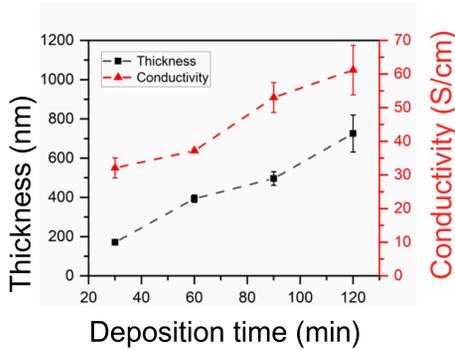

Effect of Nitrogen Flow and Time on oCVD Process

Nitrogen as oxidant carrier gas

impacting distribution of the oxidant onto the substrate

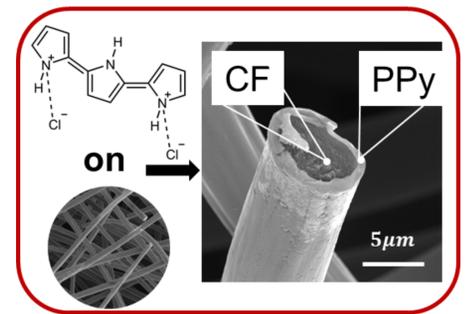

influencing the thickness and electrical conductivity

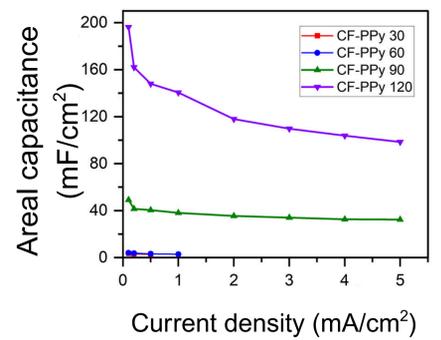

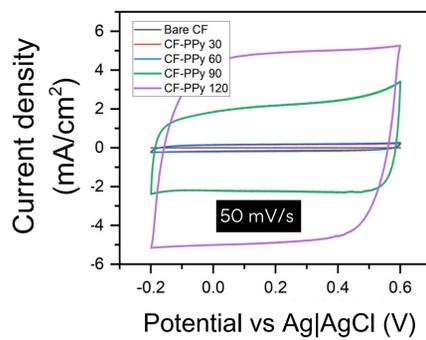

Extending the **deposition time** → increasing the film **thickness** and enhancing **conductivity**

Energy Storage Relevance

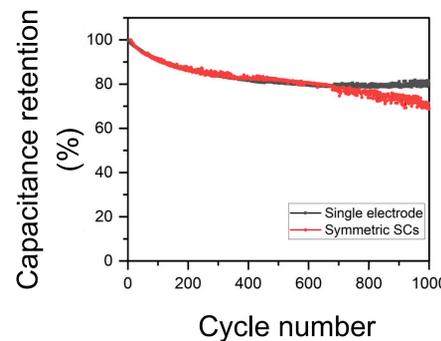

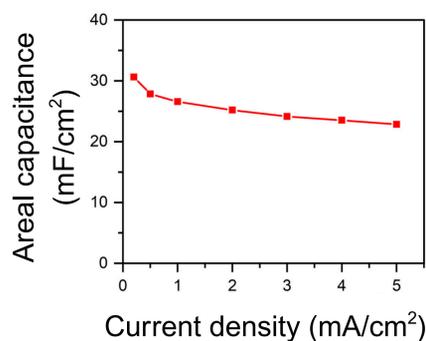

Development of electrodes for supercapacitor

Effect of deposition time on electrode performance

Symmetric supercapacitor device

Outlook

- Simulate the oCVD process with CFD
- Assemble a supercapacitor + solid electrolytes
