Conclusions

- Novel biobased (co)polyesters based on camphoric acid have been successfully synthesized.
- (Co)polyesters with \overline{M}_n 4,500-14,700 g/mol were achieved through bulk polycondensation.
- The glass transition temperatures follow the sequence: T_g PCHC > T_g PEC > T_g POC.
- The obtained (co)polyesters are thermally stable up to 410 – 428 °C.
- The incorporation of cyclic diol 1,4-CHDM further increases the T_g of copolymers.
- WAXD shows that only 1,4-CHDM produces semicrystalline polymers.

Acknowledgements

Jur van Dijken, Louis Pitet, and Subin Damodaran are greatly acknowledged for their assistance with TGA and SEC measurements. S.A. gratefully acknowledges the financial support from the Indonesia Endowment Funds for Education (LPDP).
